

Focus Salmo
Target achieved!

Focus Salmo is the Skretting innovative proposal for trout pigmentation, based upon long-term experience in salmon. Skretting knows that good pigmentation results need a specific formulation, not just a standard grower feed with pigments on top.

Focus Salmo is based on three pillars.

Specific balance of essential nutrients profile

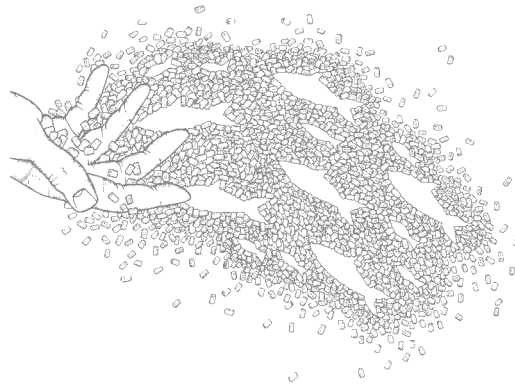

Essential nutrient level is balanced to ensure better fillet texture and colour stability after processing

Raw materials selection

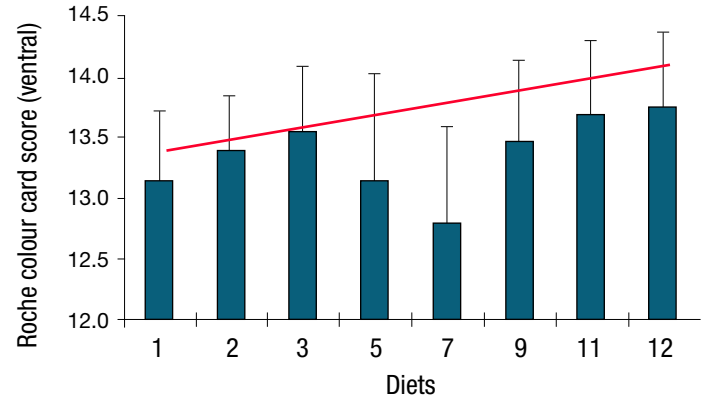

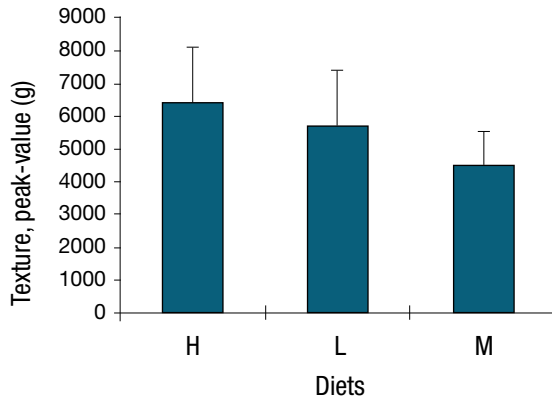

Raw materials are selected taking into account their impact on pigmentation

Antioxidant protection

Formulation designed to protect carotenoids against oxidation both in the feed and in the fish

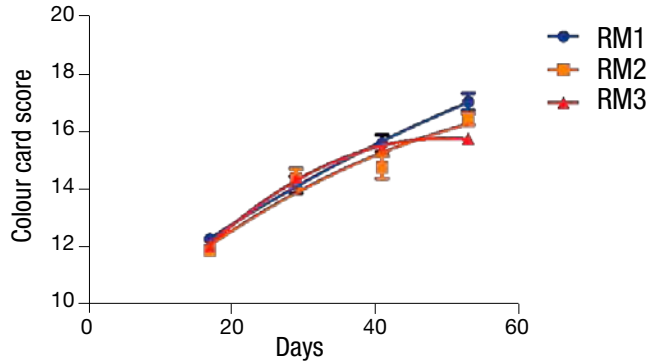

Skretting ARC has demonstrated that a specific essential nutrient profile has positive effect on fillet texture and colour stability after processing.

The specific formulation of Focus Salmo ensures better product quality and shelf-life!

Carotenoid pigments such as astaxanthin and cantaxanthin are extremely prone to oxidation. Some raw materials contain natural antioxidants while others exhibit pro-oxidant effect.

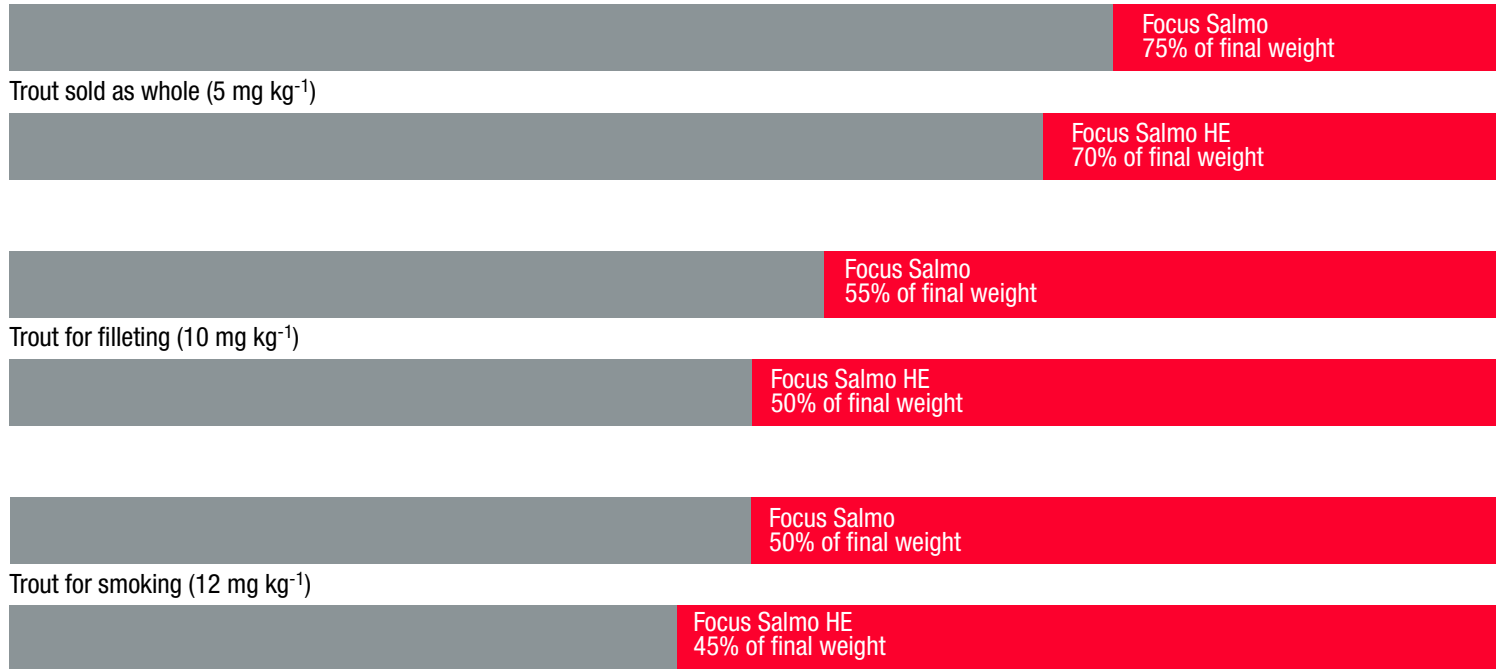

Skretting recommends a specific formulation for pigmenting feeds, as our experience tells us that this is needed to avoid carotenoid pigment oxidation and ensure their absorption, deposition and stability in the fillet after processing.

This is the Skretting Active Nutrition concept: to verify nutrient requirements of fish under different conditions and design a feed for every need!

Focus Salmo

When should I start feeding Focus Salmo?

Feeding your
passion
for fish
